

# Supplemental Information: Weather impact on racial composition and citation activity of traffic stops in the United States

March 16, 2024

The following document presents supplemental information for the paper *Weather impact on racial composition and citation activity of traffic stops in the United States*. All data and code to recreate the analysis in the paper is available at <https://www.github.com/trafficstops/Paper>.

# 1 Background on Racial Disparities and Traffic Stops

Measuring the relationship between race and traffic stops is empirically challenging as administrative data only includes information on stopped drivers and not on motorists that committed traffic offences (Grogger and Ridgeway, 2006; Simoiu et al., 2017). Next to the already discussed literature using speed camera data or the veil of darkness, there is a large number of additional studies investigating the relationship between race and traffic stops, often coming to different conclusions. Some researchers find little or no evidence of racial disparities in traffic stops and citations. For instance, employing data for Cincinnati (Ohio), Ridgeway (2009) finds fewer citations being issued to black relative to white motorists and hypothesizes that this outcome is explained by black drivers being arrested as opposed to getting cited. The same author matches black drivers to motorists from other races based on infraction, time of day, and region in the City of Oakland, concluding that black drivers are treated equitably in terms of citation rates (Ridgeway, 2006). Using a driver survey conducted in North Carolina, Warren et al. (2006) suggest that racial bias is weak for highway patrol but strong for local police departments. The authors explain their results by differences in work patterns between state and local police and the higher speed of drivers on highways, relative to municipal roads, not allowing for racial profiling (Smith et al., 2001). Using nationwide data, Shane et al. (2017) argue that police killings of civilians are not motivated by race.

These studies are opposed by findings suggesting racial bias. Smith and Petrocelli (2001) find that black motorists are more likely to be stopped relative to their population share in Richmond, Virginia. Making use of data for North Carolina, Baumgartner et al. (2018) suggest racial bias after controlling for legally relevant factors for traffic stops, behavior of single police officers, and the outcomes for contraband searches. Based on administrative data from the Oakland police department, Hetey et al. (2016) demonstrate that officers stopped, searched, handcuffed, and arrested more blacks than whites. This result remained statistically significant after controlling for a large number of factors shaping police actions (e.g. crime rates, police officer characteristics).

An additional stream of research analyzes factors influencing the racial distribution of traffic stops and actions during them. Rojek et al. (2012) demonstrate that black (white) drivers are more likely to be searched in a predominantly white (black) neighborhood by white police officers. Analyzing audio recordings of traffic stops in Oakland (California), Hetey et al. (2016) find that “*more severe legal language*” is used by police officers during stops of black residents. Several researchers also find a relationship between officers’ race and gender in the use of force during encounters with the police (Ba et al., 2021; Hoekstra and Sloan, 2022). Stopping location and race of police officers play a role in assessing traffic stops as well, as shown by Roh and Robinson (2009) and Rojek et al. (2012).

There is also a large amount of research related to the relationship between crime and weather with routine activities and heat-aggression theory as the two main strands (Sommer et al., 2018). Routine activities theory postulates that warm and dry weather leads to more outdoor activities and hence, higher probability of victim-offender interaction. We control for a potential shift in the amount of drivers on the road and the related greater likelihood of infractions, during warm and dry weather, by analyzing the racial distribution of drivers during stops and not the number of traffic stops. Heat-aggression theory postulates that high temperatures increases bad temper and annoyance, leading to more aggressive behavior. This behavior is, however, less likely for

motorists, as most cars have air conditioning to reduce the temperature in cars.<sup>1</sup> To analyze more rigorously if weather differently impacts crimes committed by race, we conducted a literature review spanning publications from 1970 to the most recent years ([Anderson et al., 1995](#); [Bell and Baron, 1976](#); [Bushman et al., 2005](#); [Cohen and Felson, 1979](#); [Cohn, 1990, 1993](#); [Cohn and Rotton, 1997, 2005](#); [DeFronzo, 1984](#); [Harries et al., 1984](#); [Jacob et al., 2007](#); [Mares, 2013](#); [Rotton and Cohn, 2001](#); [Sommer et al., 2018](#)). Since the 1970s, researchers have consistently shown that weather influences crime rates, but none of these studies claim or find that rain or cold/heat have an effect on crime that differs by race. To our knowledge, there are also no studies demonstrating that adverse weather conditions influence traffic infractions differently between non-white and white drivers.

---

<sup>1</sup>Already in the early 1960s about 80% of cars in the Southwest were equipped with air conditioning ([Phelan and Sorge, 1990](#)). Over the last two decades almost all cars sold had standard air conditioning according to [Automotive Air Conditioning History](#) published in *Motortrend* on 24 June 2010.

## 2 Summary Statistics on Race and Citations

Tables 1 and 2 summarize the distribution of black, Hispanic, and white drivers by city and state police, respectively. Note that for some cities and states, data is missing regarding the issuance of citations whereas for others, the summary statistics indicate that for 100% of stops a citation was issued. For the analysis with *citation* as the dependent variable, all cities and states with a value of 100% citations were removed.

City	State	Black	Hispanic	White	Citation
Connecticut	CT	14%	12%	74%	
Florida	FL	19%	22%	59%	
Georgia	GA	30%	3%	67%

**Table 2.** Percentage distribution of black, Hispanic, and white drivers during traffic stops by city police.

### **3 Daily and Hourly Pattern of Traffic Stops by Race/Ethnicity**

Figure 1 and 2 depict the patterns of traffic stops over a 24-hour period. Given the large variation in patterns, individual estimation by city and state police department using hourly dummy variables is preferred over a fixed effects logit model.

**Figure 1.** Fraction of Daily Traffic Stops by Time and Race/Ethnicity

**Figure 2.** Fraction of Hourly Traffic Stops by Time and Race/Ethnicity

## 4 Temperature and Precipitation Patterns

There are also differences in the intensity of rain and heat/cold across the jurisdictions in our model. Hence, the separation of the models by jurisdiction is warranted. Note that all the results presented for the jurisdiction-specific models are based on relative precipitation and temperature as described in the main manuscript.

Jurisdiction	State	Max. Precipitation		Temperature					
		1-hour	20-min	Min.	Q1	Q2	Mean	Q3	Max.
